Portfolio — yurapion.github.io
GitHub — yurapion
LinkedIn — yurii-piontkovskyi

LANGUAGES

English — Professional working
Ukrainian — Native
Russian — Fluent

CORE SKILLS

- Multi-tenant architecture and schema design
- Authentication and authorization
- Microservices and distributed systems
- Event-driven / async architecture
- Cloud-native (AWS, Azure, ECS)
- Agentic workflows in production
- Data compliance and security
- Realtime UX (SignalR, WebSockets)
- CI/CD and infrastructure as code
- Directing engineers and client delivery

TECH STACK

Languages
TypeScript, JavaScript, Go, C# (.NET), Dart, SQL

Frontend
React 17–18, Vite, Redux Toolkit, React Query, Apollo, MUI, Flutter, Riverpod

Backend
NestJS, Node.js, Fastify, ASP.NET Core, MediatR, GraphQL (Hasura, Apollo, gqlgen), REST

Data
PostgreSQL, TypeORM, InfluxDB, DynamoDB, Dgraph, Kafka, EF Core, Hasura

Cloud / Infra
AWS (Cognito, ECS, Lambda, SQS, S3, SageMaker), Azure (App Service, AD B2C, Blob), Docker, Kubernetes, Terraform

DevOps
GitHub Actions, Bitbucket Pipelines, Drone, Flux/ArgoCD, Helm, SonarQube, Testcontainers, Sentry

INDUSTRIES

- Clinical VR / biosensing
- Healthcare and NHS
- Medical imaging and AI/ML
- Consumer media and insights
- Hospitality / restaurant SaaS

PROFESSIONAL SUMMARY

Staff engineer with 8+ years building production platforms in healthcare, clinical VR, AI-assisted imaging, consumer media, and SaaS. At Evolve I own the cloud architecture for a clinical headset platform: identity, the application database, and the operator product. I direct another engineer on that platform.

Before that, end-to-end ownership of Node.js/TypeScript, Go, .NET, React, and Flutter systems, including infrastructure as code, NHS-grade data compliance, and CI/CD. I also run AI agents as a verified engineering multiplier against live production systems. Case studies: yurapion.github.io.

EXPERIENCE

Evolve
Staff Engineer | Sep 2026 – Present | Remote
Staff engineer on the cloud platform for a clinical VR headset. I own architecture across identity, the application database, and the operator product, and I direct another engineer on that platform.

- PostgreSQL holds application data: 19 tables and 33 TypeORM migrations. A session cannot point at a participant or device from another organization. Row-level security still applies when a query forgets its filter. The service connects as a role that does not own the tables, because a table owner bypasses those policies without an error.
- Operator and device identity are in Cognito. The token decides the organization. A device credential resolves to the organization that owns the headset.
- I ship the operator application for a live headset session: create and start a run, signal quality, live sensor traces, and a CSV export that returns an error when it fails.
- Export jobs travel on the Kafka cluster already running in every environment. The data_exports row is the source of truth for status. I own that decision.

Blum Health (via Honeycomb Software)
Senior Full-Stack Engineer | Jul 2023 – Present | Remote
Lead engineer across three concurrent client products spanning healthcare, medical imaging AI, and restaurant SaaS — owning architecture, delivery, and client communication on each.

CardMedic — Healthcare communications

- Architected 9 Node.js/TypeScript microservices on AWS (Lambda, API Gateway, DynamoDB, SQS/SNS, S3, Cognito), deployed across 20+ NHS trusts.
- Scaled translation throughput with sharded SQS queues, batching, DLQ monitoring, and CloudWatch to Slack alerting: 100k+ translation jobs/month without API throttling.
- NHS data compliance: AES encryption at rest for transcripts, multi-year retention, HMAC webhook verification, and a feature-flagged path to swap translation providers without forking the codebase.
- React admin platform and a Flutter app with 55 locales, delivered via GitHub Actions.

AI Sight Suite — Clinical imaging and AI screening

- Built a .NET 10 Clean Architecture backend, PostgreSQL via EF Core, with LanguageExt Either/Option for explicit error handling.
- Cross-cloud: Azure for hosting, AD B2C, and blob storage; AWS SageMaker for dual-model inference. 5,000+ retinal screenings across pilot clinics (delivery record).
- Tiered clinical audit, DICOM pipelines, and a React 18 + Vite SPA with SignalR grading updates. Testcontainers, SonarQube, and Terraform-managed Azure infrastructure.

AccentPOS — Restaurant and venue SaaS

- Hasura + Fastify, PostgreSQL with 326 SQL migrations as the schema backbone, live across 30+ venues (delivery record).
- Payments, QR payment links, and Cognito JWT bridged into Hasura session variables for tenant-scoped access.
- PayPal, Dojo, Deliverect, and Xero behind one integration path. React operations platform with live order subscriptions.

Wunder AI
Senior Full-Stack Engineer | Mar 2020 – Sep 2023 | Remote

- React frontends on a shared Apollo GraphQL + WebSocket layer: Playtime (branded festival SPA, 100k+ attendees in the delivery record) and Target Group (Cytoscape/D3).
- LiveMind realtime session mirroring: the B2B app embeds the consumer SPA and mirrors participant activity through shared GraphQL subscriptions.
- Contributed to a Go + gqlgen monorepo (49 command binaries) with Dgraph, PostgreSQL, and Kafka, and a rule-book-to-Go generator for consumer profiling.
- Drone, Kaniko, Kubernetes, Flux/ArgoCD, and Prometheus/Grafana.

Freelance / Contract
Full-Stack Engineer | Mar 2017 – Mar 2020 | Remote

- Multi-tenant React dashboards and Node.js/Express APIs on PostgreSQL and MongoDB, with JWT auth, role-based access, and Stripe.
- Docker, GitHub Actions / GitLab CI, and direct work with founders on scoping and delivery.

SECURITY AND COMPLIANCE

- PostgreSQL row-level security keyed on the organization
- AES encryption, S3 SSE, HMAC verification
- NHS / clinical multi-year retention
- OAuth2, Cognito, Azure AD B2C, JWT
- Tenant and role-scoped access (Hasura, claims)

LEADERSHIP

- Direct an engineer on the Evolve platform: schema, authentication, and tenancy rules.
- Mentored interns and juniors through code-level guidance and PR reviews.
- Direct client communication on priorities, trade-offs, and delivery timelines.

EDUCATION

Bachelor, Computer Engineering
Taras Shevchenko National University of Kyiv
2013–2017

AI-ASSISTED ENGINEERING

- Run AI agents against live production systems from written runbooks: dry-run, small live test, then rollout, with DLQ alarms as the safety net.
- A frontier model plans and reviews, cheaper agents do read-heavy work, and an independent agent verifies changes before they ship.
- Built graphify (codebase to a queryable knowledge graph, used across three client repos) and DevPrep, an interview-preparation product on the Claude API.

METHODS

- Schema as code: TypeORM and SQL migrations
- Row-level security and foreign keys that include the tenant
- Feature flags for safe rollout
- Clean Architecture and CQRS where the domain needs them
