

YURII PIONTKOVSKIY

Staff Engineer | Cloud-Native & Distributed Systems | Agentic Delivery

CONTACT

yurapion@gmail.com
Remote | Open to UK / EU / Global
[Portfolio — yurapion.github.io](#)
[GitHub — yurapion](#)
[LinkedIn Profile](#)

LANGUAGES

English — Professional working
Ukrainian — Native
Russian — Fluent

CORE SKILLS

- Microservices & distributed systems
- Event-driven / async architecture
- Cloud-native (AWS, Azure, K8s)
- Agentic AI workflows in production
- Data compliance & security
- Realtime UX (SignalR, WebSockets)
- CI/CD & infrastructure as code
- Client-facing delivery & mentoring

TECH STACK

Languages

TypeScript, JavaScript, Go, C#
(.NET), Dart, SQL

Frontend

React 17–18, Vite, Redux Toolkit,
React Query, Apollo Client, MUI,
Flutter, Riverpod

Backend

NestJS, Node.js, Fastify, ASP.NET
Core, MediatR, GraphQL (Hasura,
Apollo, gqlgen), REST APIs

AI / Agents

Claude API, agentic workflows,
MCP, prompt-driven runbooks,
knowledge graphs

Cloud / Infra

AWS (Cognito, ECS, Lambda, SQS,
DynamoDB, S3, SageMaker), Azure
(App Service, AD B2C, Blob, VNet,
PostgreSQL), Docker, Kubernetes,
Terraform

PROFESSIONAL SUMMARY

Staff engineer with **8+ years** building scalable, production-grade platforms in **healthcare, clinical VR, AI-assisted imaging, consumer media, and SaaS**. At **Evolve** I own the cloud architecture for a clinical headset platform: identity, the application database, and the operator product.

End-to-end ownership of **Node.js/TypeScript, Go, .NET, React, and Flutter** systems — from architecture through production, including infrastructure as code, NHS-grade data compliance, and CI/CD. I also run **AI agents as a verified engineering multiplier** — against live production systems, with runbooks and independent verification. Case studies: [yurapion.github.io](#).

AI-ASSISTED ENGINEERING

Agents applied where the work can be checked — production operations, codebase intelligence, and product.

- Run AI agents against **live production systems**: bulk translation rollouts on CardMedic's AWS pipeline execute from written runbooks — dry-run, small live test, then language-by-language rollout with DLQ alarms as the safety net.
- Operate a measured **multi-agent development workflow**: a frontier model plans and reviews, cheaper specialised agents do read-heavy work, and an independent agent verifies changes before they ship.
- Built **graphify** (codebase → queryable knowledge graph, used daily across three client repos) and **DevPrep**, an AI-first interview-preparation product on the Claude API.

EXPERIENCE

Evolve

[Staff Engineer](#) | [Sep 2026 – Present](#) | [Remote](#)

Staff engineer on the cloud platform for a clinical VR headset. I own architecture across identity, the application database, and the operator product, and I direct another engineer on that platform.

- **PostgreSQL** holds application data: **19 tables** and **33 TypeORM migrations**. A session cannot point at a participant or device from another organization. **Row-level security** still applies when a query forgets its filter. The service connects as a role that does not own the tables, because a table owner bypasses those policies without an error.
- Operator and device identity are in **Cognito**. The token decides the organization. A device credential resolves to the organization that owns the headset.
- I ship the operator application for a live headset session: create and start a run, signal quality, live sensor traces, and a CSV export that returns an error when it fails. **NestJS** serves the API and the Socket.IO gateway; the app is **React 18 + Vite**.
- Export jobs travel on the **Kafka** cluster already running in every environment. The `data_exports` row is the source of truth for status. I own that decision. Sensor samples stay in **InfluxDB**.

Blum Health (via Honeycomb Software)

[Senior Full-Stack Engineer](#) | [Jul 2023 – Present](#) | [Remote](#)

Lead engineer across three concurrent client products spanning healthcare, medical imaging AI, and restaurant SaaS — owning architecture, delivery, and client communication on each.

CardMedic — Healthcare Communications Platform

Clinical communication platform deployed in NHS settings — content, translation, and speech at scale.

- Architected **9 Node.js/TypeScript microservices** on AWS (Lambda, API Gateway, DynamoDB, SQS/SNS, S3, Cognito) serving **200+ REST endpoints** across three environments — deployed across **20+ NHS trusts**.
- Scaled translation throughput with **21 sharded SQS queues**, batching, DLQ monitoring, and CloudWatch → Slack alerting — sustaining **100k+ translation jobs / month** without API throttling.
- Implemented **NHS data compliance**: AES encryption at rest for transcripts, 8-year retention, HMAC webhook verification, and a feature-flagged vendor migration path that allowed swapping translation providers (Smartcat) without forking the codebase.
- Delivered a **React** admin platform and a **Flutter** cross-platform app with **55 locales**, three-layer RTL detection, and screen-reader accessibility — deployed via multi-region **GitHub Actions** CI/CD.

Data

PostgreSQL, TypeORM, InfluxDB, DynamoDB, Dgraph, KeyDB/Redis, Kafka, EF Core, Hasura

DevOps / Quality

GitHub Actions, Bitbucket Pipelines, Drone CI, Flux/ArgoCD, Helm, SonarQube, Testcontainers, Sentry, Prometheus/Grafana

INDUSTRIES

- Clinical VR / biosensing
- Healthcare & NHS
- Medical imaging & AI/ML
- Consumer media & insights
- Hospitality / restaurant SaaS

METHODS & PRACTICES

- Agile / Scrum, remote-first delivery
- Schema-as-code (SQL migrations, EF Core)
- Feature flags for safe vendor migration
- Clean Architecture, CQRS (MediatR)
- Git, trunk-based and branch-based flows

SECURITY & COMPLIANCE

- PostgreSQL row-level security keyed on the organization
- AES encryption, S3 SSE, HMAC verification
- NHS / clinical multi-year retention
- OAuth2, Cognito, Azure AD B2C, JWT
- Tenant & role-scoped access (Hasura, claims)

LEADERSHIP

- Direct an engineer on the Evolve platform: schema, authentication, and tenancy rules.
- Mentored interns and juniors through hands-on code-level guidance and PR reviews.
- Direct client communication on priorities, trade-offs, and delivery timelines.
- Cross-functional collaboration with product, design, and ops teams.

EDUCATION

Bachelor, Computer Engineering

Taras Shevchenko National University of Kyiv
2013–2017

EARLY CAREER

Independent contractor on consumer web and SaaS projects — full-stack delivery, client-direct.

AI Sight Suite — Clinical Imaging & AI Screening

Regulated imaging platform for diabetic retinopathy screening — AI grading, multi-tenant licensing, clinical audit.

- Built a **.NET 10 Clean Architecture** backend with **100+ REST endpoints**, a rich domain model (~80 entities), **PostgreSQL** via EF Core, and **LanguageExt** Either/Option for explicit, functional-style error handling.
- Designed a **cross-cloud architecture**: Azure for hosting, identity (AD B2C), and blob storage; **AWS SageMaker** for dual-model AI inference with Signature V4 auth — processing **5,000+ retinal screenings** across pilot clinics.
- Implemented **tiered clinical audit** (5/10-year retention), DICOM imaging pipelines, multi-encounter batch workflows, and **Xero** billing integration for B2B invoicing.
- Delivered a **React 18 + Vite** SPA with SignalR realtime AI grading updates and Konva-based image interaction; quality held by **Testcontainers** integration tests, **SonarQube + dotCover** in Bitbucket Pipelines, and **Terraform**-managed Azure infrastructure.

AccentPOS — Restaurant & Venue Management SaaS

Multi-site restaurant platform — ordering, stock, payments, delivery aggregation, and finance.

- Designed a **Hasura + Fastify** architecture with **14 event-trigger webhooks** separating GraphQL data access from imperative business logic — backed by **PostgreSQL** with ~330 SQL migrations as the schema-as-code backbone, live across **30+ venues**.
- Built commerce flows end to end: create/capture payments, **QR payment links** with expiry, served/takeaway/delivery paths, and **runtime theming** per venue from backend config.
- Integrated **PayPal, Dojo, Deliverect, Xero**, and **AWS Cognito** — bridging Cognito JWT into Hasura session variables for **tenant-scoped** GraphQL access control.
- Delivered a **React** operations platform (Apollo + subscriptions, MUI, DevExpress Scheduler, drag-and-drop) with **Docker Compose + Traefik** for local dev and role-scoped dashboards.

Wunder AI

Senior Full-Stack Engineer | Mar 2020 – Sep 2023 | Remote

Cosnova / Wunder AI — connected product ecosystem: consumer festival experiences, B2B insight dashboards, and a shared Go/GraphQL backend.

- Built **React** frontends on a shared **Apollo GraphQL + WebSocket** layer: Playtime (**20 branded app configs** from one SPA with per-brand themes, 35+ template types, adaptive video, maps, barcode scanning) reaching **100k+ festival attendees**, and Target Group (Cytoscape/D3 visualisations).
- Delivered **LiveMind** realtime session mirroring — the B2B app embeds the consumer experience via iframe and mirrors participant activity through shared GraphQL subscriptions.
- Contributed to **cosnova-mono**, a large-scale **Go + gqlgen** backend monorepo with polyglot persistence (**Dgraph, PostgreSQL, KeyDB, Kafka**) and a rule-based inference engine for consumer profiling.
- Delivery via **Drone → Kaniko → ACR → Kubernetes; Flux/ArgoCD** for GitOps, Helm charts, Prometheus/Grafana/Loki observability, and Backstage service catalogue.

Freelance / Contract

Full-Stack Engineer | Mar 2017 – Mar 2020 | Remote

Independent contracts across web and mobile delivery for early-stage clients — React/Node.js SPAs, REST/GraphQL APIs, and CI/CD setups.

- Delivered multi-tenant **React** dashboards and **Node.js / Express** REST APIs on PostgreSQL and MongoDB, with JWT auth, role-based access, and Stripe payment integrations.
- Containerised services with **Docker**, set up **GitHub Actions / GitLab CI** pipelines, and worked directly with founders on scoping, estimates, and iterative delivery.
